Push notification

What are push notifications?

A push notification is a message that pops up on a web page. Users can send them at any time, users don't have to be on the page or logging in to receive them. They can do a lot of things for example, they can show the latest sports scores, get a user to take an action, such as downloading a coupon, or let a user know about an event, such as a flash sale. Push notifications look like SMS text messages and mobile alerts.

How it works in ISOACCESS

When the user change the specific update then, the notification will be send to corresponding users/owners or agents. (i.e) if any lead created then the corresponding agent will get the notification.

Notification message having reply option, by using this option end user can ask queries/reply to the sender.

Notification is the coolest feature :)

- IsoAccess will notify you instantly the changes made on your accounts
- Quick chat facility is available to ask the person who initiates the change
- They can also reply their explanation
- It really helps to save your time to mail your colleague
